FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES
RESPONSIBLE FOR APOPTOSIS EXECUTION: CLEAVES AND ACTIVATES STEROL
REGULATORY ELEMENT BINDING PROTEINS (STEBPS). OVEREXPRESSION
PROMOTES PROGRAMMED CELL DEATH (BY SIMILARITY).
SUBBURIT: HETERODIMER OF A 20 kDa (P20) AND A 11 kDa (P11) SUBBURIT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Cytoplasmic:
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN HEART, LUNG, LIVER, AND
KIDNEY. LOW LEVELS IN SPELEEN, SKELETAL MUSCLE, AND TESTIS. NO
EXPRESSION IN THE BRAIN.
PTM: CLEAVAGES BY GRANZYME B OR CASPASE-10 GENERATE THE TWO ACTIVE
SUBUNITS: PROPEPTIDE DOMAINS CAN ALSO BE CLEAVED EFFICIENTLY BY
COP522 PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF
CASPASE-7 AND THE LARGE SUBUNIT OF CPP32 PROTEASE ALSO OCCUR AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                           VICE VERSA (BY SIMILARITY).
SIMILARITY: BELONGS TO PEPTIDASE FAMILY C14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Biophys. FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT PROTECULY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX-LOOPHELIX LEUCINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHENT DOMAIN. CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY). SUBUNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT

Chem.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ENZYME REGULATION: INHIBITED BY ISATIN SULFONAMIDES.
SUBUNIT: HETERODINER OF A 17 kDa (P17) AND A 12 kDa (P12) SUB
SUBCELLULAR LOCATION: Cytoplasmic.
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN LUNG, SPLEEN, HEART,
AND KIDNEY. MODERATE LEVELS IN BRAIN AND SKELETAL MUSCLE, AND
IN TESTIS. ALSO POUND IN MANY CELL LINES, HIGHEST EXPRESSION
CELLS OF THE IMMUNE SYSTEM.

TISSUE SPECIFICITY: HIGHEST EXPRESS
KIDNEY AND HEART. LOWER EXPRESSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mitted (MAY-1997) to the EMBL/GenBank/DDBJ databases. FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES RESPONSTBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT PROTECLYTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEEROL REGULATORY ELEMENT BINDING BROTEINS (SREBPS) BETWEEN THE BASIC HELIX-LOOPHELIX LEUCINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN. CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY). CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY). CLEAVES AND ABTWEEN AN ASP AND AN ALA, RELEASING THE MATURE CYTOKINE WHICH IS INVOLVED IN A VARIETY OF INFLAWMATORY PROCESSES. SUBUNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT BATTER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RECRUITS IT TO EITHER RECEPTORS. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS FLICE/MACH PROTEOLYTIC ACTIVATION. THE ACTIVE DIMERIC ENZYME IS THEN LIBERATED FROM THE DISC AND FREE TO ACTIVATE DOWNSTREAM APOPTOTIC PROTEASES. PROTEOLYTIC FRACKENTS OF THE N-TERMINAL PROPEPTIDE (TERMED CAP3, CAP5 AND CAP6) ARE LIKELY ETALNED IN THE DISC. CLEAVES AND ACTIVATES CASPASE 3, -4, -6, -7, -9, AND -10. MAY PARTICIPATE IN THE GRANZYME B APOPTOTIC PATHWAYS. PROTEOLYTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP). HYDROLYZES THE SMALL-MOLECULE SUBSTRATE, AC- ASP-GLU-VAL-ASP-|-AMC. LIKELY TARGET FOR THE COMPON VIRUS CRMA DEATH INHIBITORY PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ALPHA,/MCH5-BETA, 3-ALPHA, 4-ALPHA, 1-BETA, 2-BETA, 3
